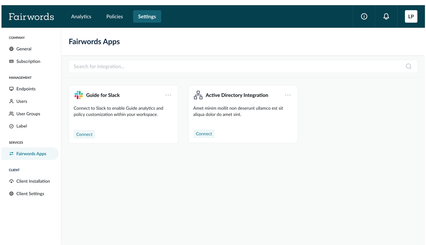
FW-3336

• Waiting for Review

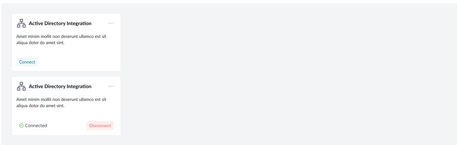
AD Integration controls placement

- We can use FW Apps page to provide Users with UI for setting up the AD sync
- This page is underused right now and may potentially contain any integration flow
- Since we are planning to support different AD integrations we can use generic icon and provide overall description for this feature

- We can use FW Apps page to provide Users with UI for setting up the AD sync
- This page is underused right now and may potentially contain any integration flow
- Since we are planning to support different AD integrations we can use generic icon and provide overall description for this feature

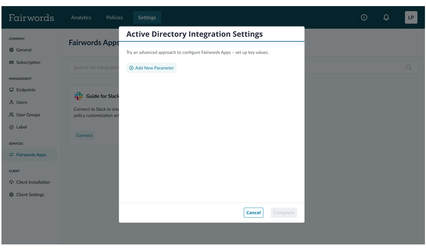


- I would suggest to make a small change to existing UI for initiating App connection.
- right now there are no action buttons inside the App plate, and user needs to access the More icon to initiate Connect.
- We can display the Connect button inside the App plate right away. For connected Apps we need to show status "Connected" and the button should be changed to Disconnect

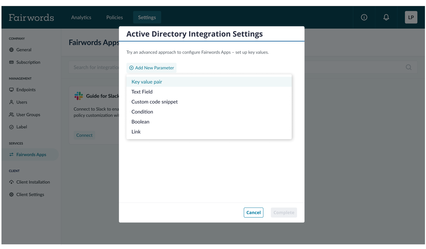


AD Set up or Settings

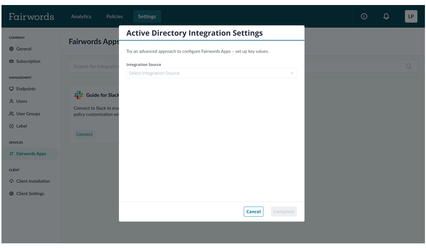
- Upon clicking the "Connect" button User will start the Integration flow.
- Integration flow may be implemented as a new page, sidebar (like create ne Policy) or as in this example in a new modal window. It depends on the complexity of this integration.
- New Modal window contains the "Add New Parameter" button



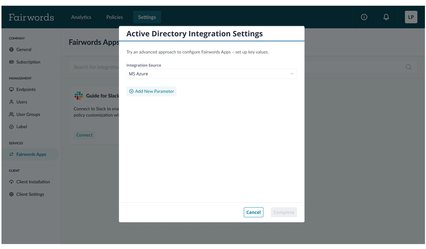
- User can add various predetermined parameters and fill them afterwards.
- It could be not just key value pairs but other data types, depending on what we might need in the setup process.



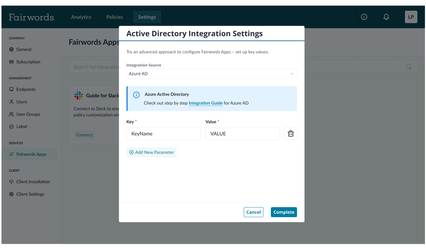
- The process itself is an open question for me. We need to discuss what data points we need to connect in order to have a successful integration
- !!!! Important question is different integrations, I mean apart from Azure AD, Paul mentioned that we might have other options. In that case we need to thought through each individual platform.
- We can have the another dropdown where User can specify which integration he/she wants

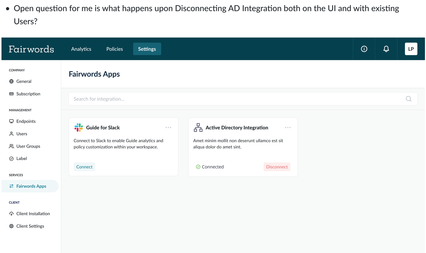


- Add New Parameter button appears after User selects the Integration source



- After selecting certain parameter (Key value pair, in this case) User can type the data, delete parameter.
- Users might need additional guidance on how to do th integration for the specific integration source. We can at least provide User with documentation link





- After successful integration the App plate should display the new status "Connected" and the "Disconnect" button
- Open question for me is what happens upon Disconnecting AD Integration both on the UI and with existing Users?
